

First of all, this method of getting the public's comments is useless because nobody wants to post their address publicly on the internet.

Secondly, you're asking what an appropriate data cap is? The appropriate cap is that there should be no cap. Why does massless data need a cap? The major ISP companies of this country are gigantic corporations that are more powerful than our own government. They don't care about their customers at all and they never put any of the huge profits they steal into their own infrastructure. If they would just build proper networks and stop being greedy executives and lobbyists, USA could actually compete with the rest of the world with internet speed and quality and everyone could have fast internet. There shouldn't be an arbitrary "cap" placed for the sole purpose of making more money for nothing.

In regards to speed and what constitutes "broadband"? Google was seemingly trying to kickstart the ISPs or take matters into their own hands by introducing their 1gbps internet service in Kansas City recently. Why don't you start there? 1gbps download AND upload would be a decent start. Work your way up from there. Oh, and now. Not a "vision" for 2020. Now. Remember that huge unemployment/economy problem? All the unemployed can install fiber. Done.

Then the public/customers and businesses/websites could actually start being innovative and use the amazing freedom the internet offers. We could better our people and country instead of holding all of technology and humanity back by being greedy, money-grubbing executive whores.

I thank the FCC for listening to my opinion (if you somehow read this far). Please do your only job and control these out-of-control corporate cancers to help our country. Thank you.
